

Configure a Power Supply

1. The Power Supply takeoff has been redesigned for ease of use. Start with the **Basic Characteristics** option, and work the choices from top to bottom to configure your product.

2. If you have **Notes** choose that option from the drop down menu

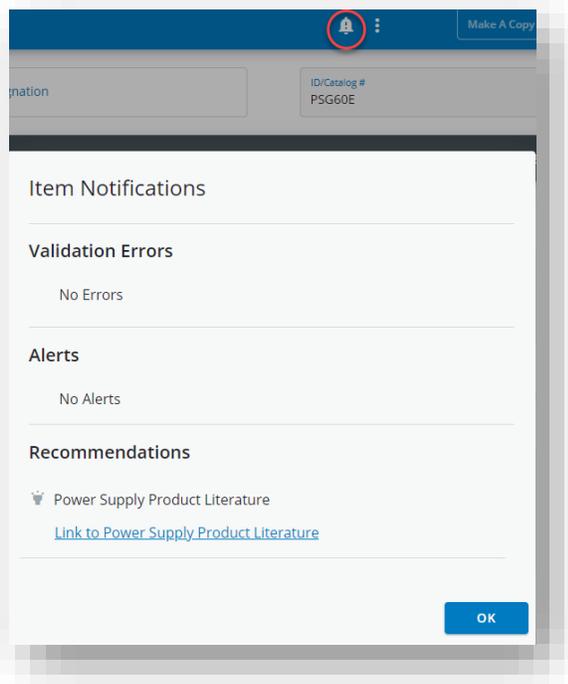

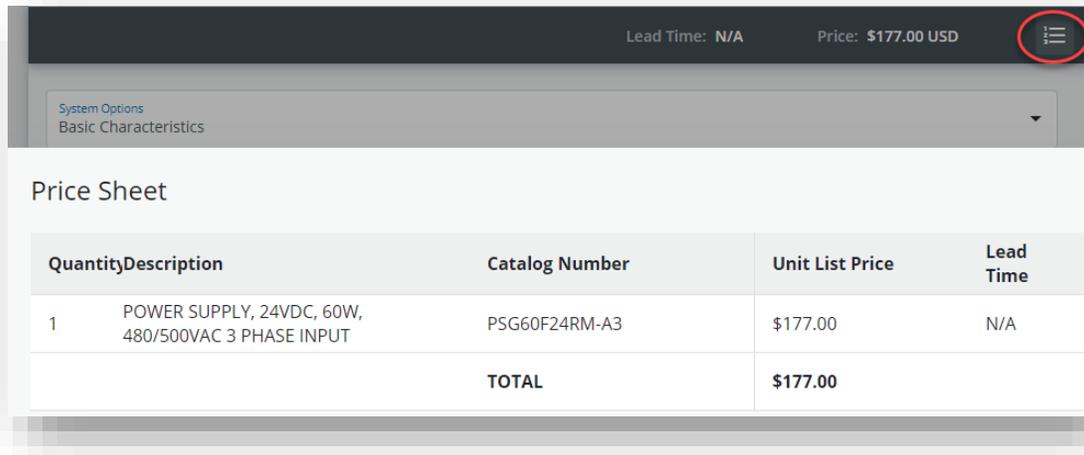

After your basic configuration, if you need to add/capture instruction specific to a job item, choose Notes at the top under Special Modifications. This would include non monetary value additional

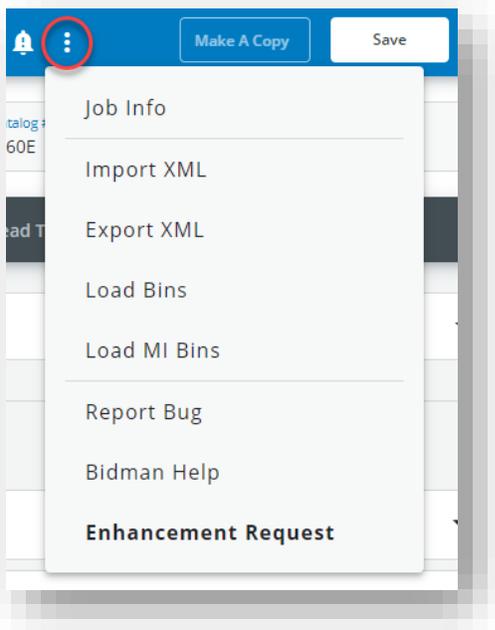

instructions specific to a panel, such as delivery instruction, specific site location, contact names at the site, etc. The notes will follow the configured assembly for the manufacturing location. It become the plant responsibility to implement the instructions per the customer requirement.

New features common to all updated take offs

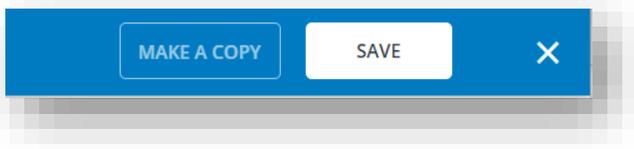

Pricing appears at the top of the configuration. A pop up with more information, including catalog number is available by clicking the **numbered list** icon.

When you click **Bell icon** or when you save your configuration, the system will check for Validation Errors and Alerts and will display the Technical Data Sheet for Power Supplies.

The Overflow menu icon (three dots) has useful but less frequently used functions that may vary based on your role.

On the top left, you can also **Make a Copy** and **Save** your item to a list of jobs in Bid Manager. The Make a copy button allows you to save multiple line items to your bill of material with different designations. It is similar to the former **Save As** button.
